GTLP1B151 1-Bit LVTTL/GTLP Transceiver with Separate LVTTL Port and Feedback Path

General Description

The GTLP1B151 is a 1-bit transceiver that provides LVTTL-to-GTLP signal level translation. Individual LVTTL and GTLP driver enables are also available. The GTLP1B151 offers separate LVTTL inputs and outputs, and can provide a feedback path for control and diagnostics monitoring.

High-speed backplane operation is a direct result of GTLP's reduced output swing (<1V), reduced input threshold levels and output edge rate control. The edge rate control minimizes bus-settling time. GTLP is a Fairchild Semiconductor derivative of the Gunning Transistor Logic (GTL) JEDEC standard JESD8-3.

Fairchild's GTLP has internal edge-rate control and is process, voltage and temperature compensated. GTLP's I/O structure is similar to GTL and BTL but offers different output levels and receiver threshold. Typical GTLP output voltage levels are: $V_{OL} = 0.5V$, $V_{OH} = 1.5V$, and $V_{REF} = 1V$.

Features

- Separate LVTTL inputs and outputs
- A feedback path for control and diagnostics monitoring
 Bidirectional interface between GTLP and LVTTL logic levels
- Designed with edge rate control circuitry to reduce output noise on the GTLP port
- V_{REF} pin provides external supply reference voltage for receiver threshold adjustibility
- Special PVT compensation circuitry to provide consistent performance over variations of process, supply voltage and temperature
- TTL compatible driver and control inputs
- Designed using Fairchild advanced BiCMOS technology
- Bushold data inputs on A port to eliminate the need for external pull-up resistors for unused inputs
- Power up/down and power off high impedance for live insertion
- Open drain on GTLP to support wired-or connection
- Flow through pinout optimizes PCB layout
- A Port source/sink –24mA / +24mA
- B Port sink +50mA

Ordering Code:

Functional Description

The GTLP1B151 is a 1-bit transceiver that supports GTLP and LVTTL signal levels. Data polarity is non-inverting with separate LVTTL inputs and outputs and there are individual GTLP and LVTTL output enable controls.

DC Electrical Characteristics (Continued)

Min Тур Max Symbol **Test Conditions** Units (Note 3) All Ports $V_{CC} = 0$ to 1.5V $V_{I} = 0$ to 3.45V I_{PU/PD} 30 μΑ $V_{CC} = 3.45V$ Outputs HIGH A or B Ports 11 I_{CC} or C Port $I_{O} = 0$ Outputs LOW 11 mA $V_I = V_{CC}/V_{TT}$ or GND Outputs Disabled 11 ΔI_{CC} A Port and $V_{CC} = 3.45V,$ One Input at V_{CC} 2 mΑ Control Pins (Note 5) A or Control Inputs at V_{CC} or GND -0.6V Ci Control Pins $V_I = V_{CC} \text{ or } 0$ 3 pF and A Port Co C Port $V_I = V_{CC} \text{ or } 0$ 5 pF C_{I/O} B Port $V_I = V_{TT}$ or 0 5.5 pF

Note 3: All typical values are at V_{CC} = 3.3V and T_A = 25°C.

Note 4: For conditions shown as Min, use the appropriate value specified under recommended operating conditions.

Note 5: This is the increase in supply current for each input that is at the specified TTL voltage level rather than V_{CC} or GND.

Note: GTLP V_{REF} and V_{TT} are specified to 2% tolerance since signal integrity and noise margin can be significantly degraded if these supplies are noisy. In addition, V_{TT} and R_{TERM} can be adjusted beyond the recommended operating to accommodate backplane impedances other than 50 Ω , but must remain within the boundaries of the DC Absolute Maximum Ratings. Similarly, V_{REF} can be adjusted to optimize noise margin.

AC Electrical Characteristics

Over recommended range of supply voltage and operating free-air temperature, $V_{REF} = 1.0V$ (unless otherwise noted).

 $C_L = 30 \text{ pF}$ for B Port and $C_L = 50 \text{ pF}$ for C Port.
