A. The value of $R_{\text{IJ(A)}}$ is measured in a still air environment with $T_A=25^\circ\text{C}$. The Power dissipation P_{DSM} is based on $R_{\text{IJ(A)}} \leq 10\text{s}$ and the maximum allowed junction temperature of 175°C . The value in any given application depends on the user's specific board design, and the maximum temperature of 175°C may be used if the PCB allows it.

B. The power dissipation P_D is based on $T_{J(\text{MAX})}=175^\circ\text{C}$, using junction-to-case thermal resistance, and is more useful in setting the upper dissipation limit for cases where additional heatsinking is used.

C. Single pulse width limited by junction temperature $T_{J(\text{MAX})}=175^\circ\text{C}$.

D. The $R_{\text{IJ(A)}}$ is the sum of the thermal impedance from junction to case $R_{\text{IJ(C)}}$ and case to ambient.

E. The static characteristics in Figures 1 to 6 are obtained using $<300\mu\text{s}$ pulses, duty cycle 0.5% max.

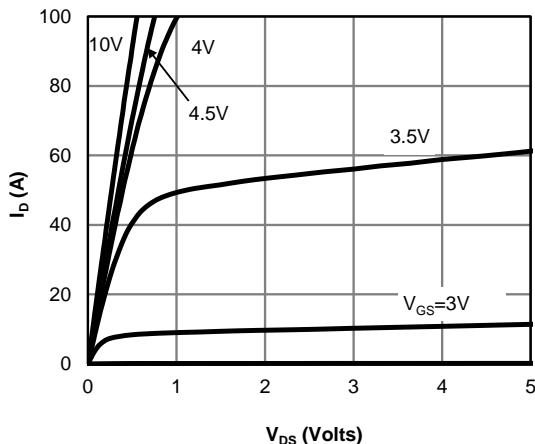

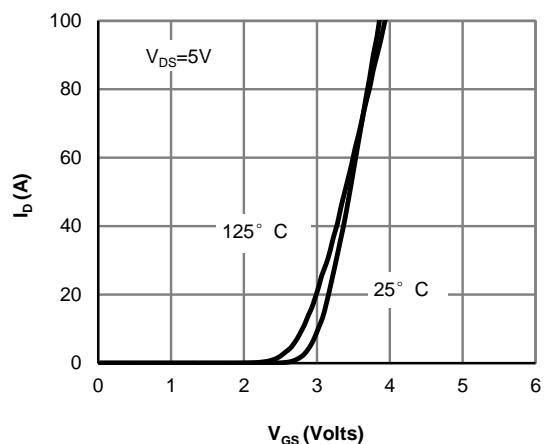

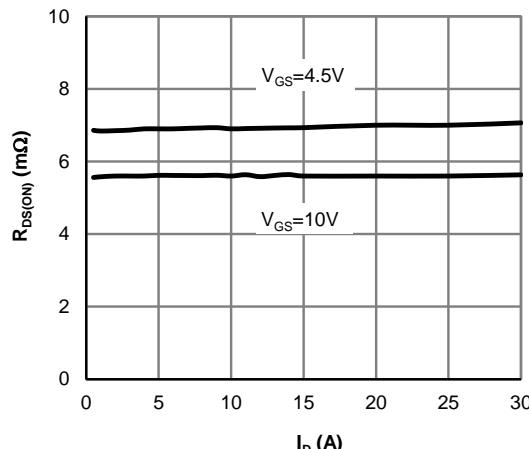

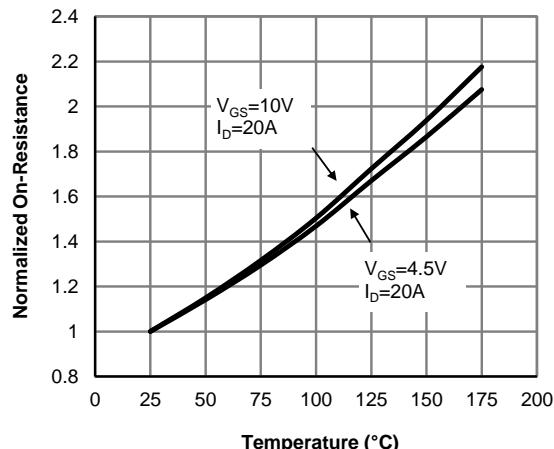

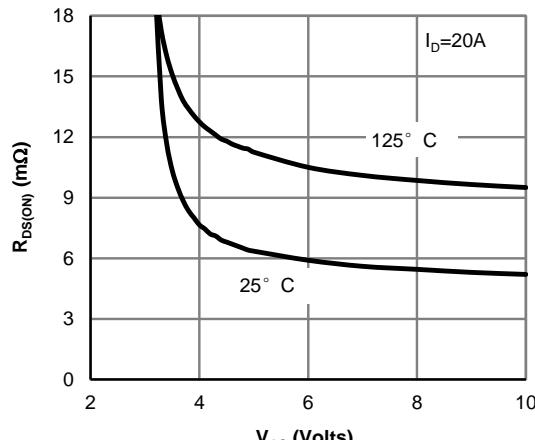

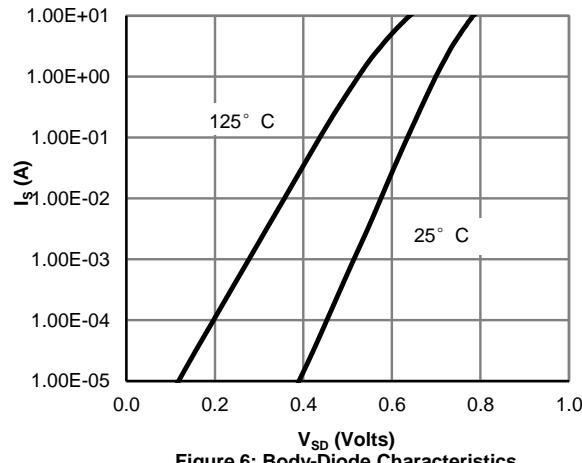

F. These curves are based on the junction-to-case thermal impedance which is measured with the device mounted to a large heatsink, assuming a maximum junction temperature of $T_{J(\text{MAX})}=175^\circ\text{C}$. The SOA curve provides a single pulse rating.

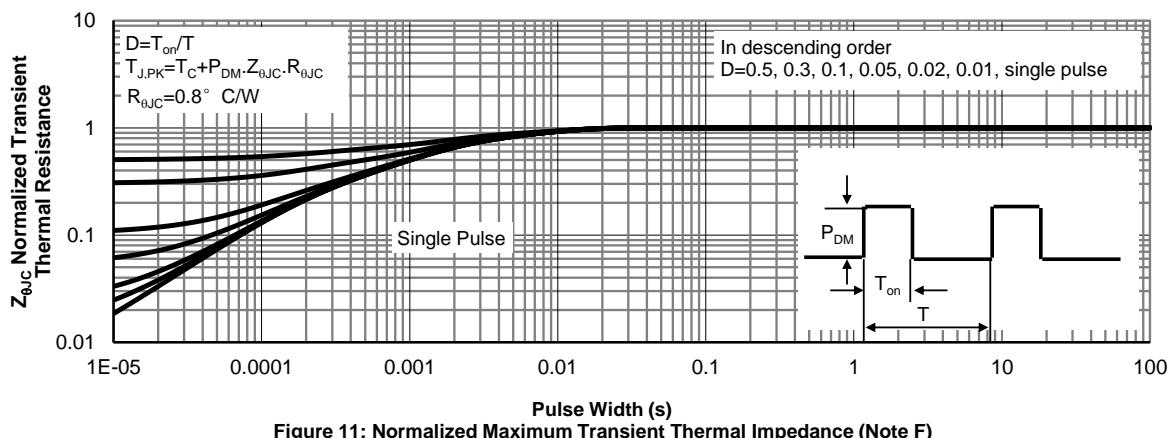

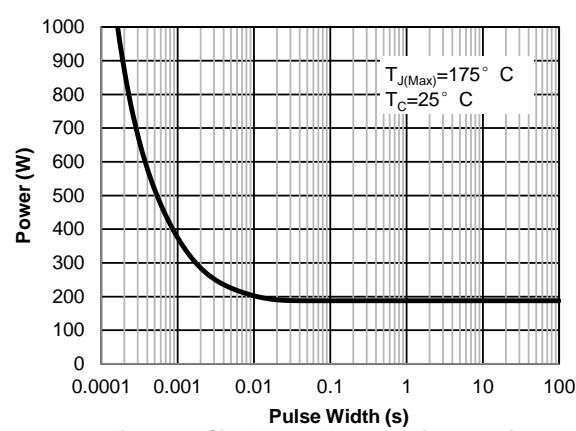

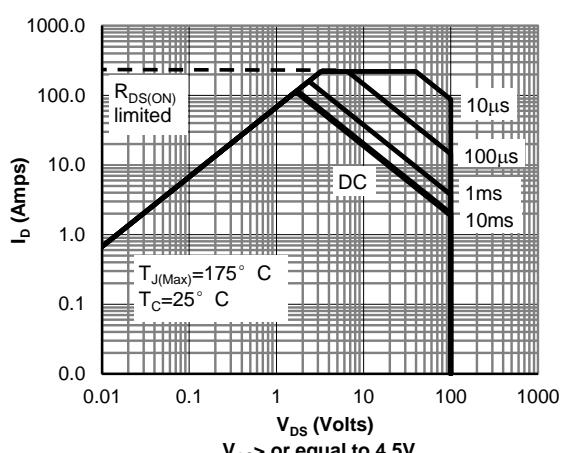

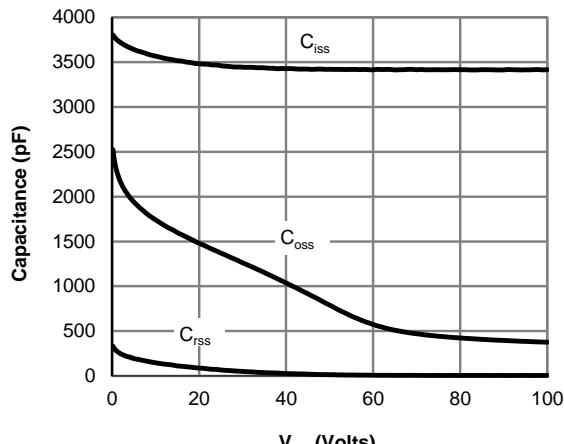

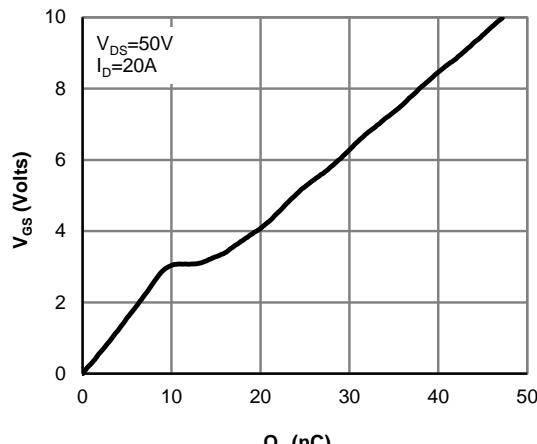

G. The maximum current rating is package limited.

H. These tests are performed in a still air environment with $T_A=25^\circ\text{C}$.
